Development and evaluation of a teleoncology system for breast cancer during the COVID-19 pandemic

Authors: [Illegible]

Background: The present study describes the work of developing a hybrid teleoncology system to provide treatment plans for breast cancer patients. Methods: The research was conducted in the form of a case study. Results: The system was developed and evaluated during the COVID-19 pandemic. Conclusion: The system is a valuable tool for providing teleoncology services during the COVID-19 pandemic.
