ABSTRACT

The objective of this research is to assess the readiness of nurses in the use of electronic health records (EHR) in the context of the Chilean health system. The study is based on a survey of 100 nurses working in a hospital in Santiago, Chile. The results show that the majority of nurses have a low level of readiness to use EHR. The main reasons for this are the lack of training and the complexity of the system. The study also identifies the need for a more user-friendly interface and better training programs for nurses. The findings suggest that the implementation of EHR in the Chilean health system requires a comprehensive approach that includes both technical and human factors.
